**Reference: Greenhouse Gas Emissions Estimate in Support of the Deadhorse Airport Improvement Draft Environmental Assessment**

In support of the Deadhorse Airport Improvements Draft Environmental Assessment on the behalf of the project sponsor, State of Alaska Department of Transportation & Public Facilities (DOT&PF), Northern Region, Stantec was requested to estimate greenhouse gas (GHG) emissions associated with mobilization, material production, construction, and demobilization activities necessary for the proposed project.

GHG emissions were calculated using the following assumptions:

- Referenced models do not include potential emission premiums for construction in arctic environments. Such premiums must be independently applied.
- The proposed project will be completed within two calendar years.
- The equipment fleet mix, construction methods, and schedule presented in this analysis are only representative proxies for calculating estimates of the magnitude of emissions to be generated.

GHG emission estimates are based on:

- Input from industry experts,
- Readily accessible data from emission models,
- Equipment manufacturer specifications, and
- Feedback from DOT&PF and other stakeholders.

A summary of estimated GHG emissions for the proposed Deadhorse Airport Improvements project are included in the following pages.

Regards,

**STANTEC CONSULTING SERVICES INC.**

**Estimated Project Combined CO2 & CO2e Emission Outputs\***

| Emission Source       | 1-Year Emissions (mt) | 2-Year Emissions (mt) |
|-----------------------|-----------------------|-----------------------|
| Mob/Demobe            | 107.3                 | 214.5                 |
| Material Production** | 86.8                  | 173.6                 |
| Material Haul         | 913.3                 | 1,826.6               |
| Construction***       | 1,033.4               | 2,066.7               |
| <b>TOTALS</b>         | <b>2,140.7</b>        | <b>4,281.4</b>        |

**Notes:**

- \* Carbon dioxide (CO2) is the most prevalent greenhouse gas (GHG). On average, it represents more than 95 percent of the impact on climate change that comes from burning transportation fuels. Methane (CH4) and nitrous oxide (N2O) are other GHG associated with fuel combustion. Because of its prevalence, some models measure CO2 emissions only, and will slightly underestimate GHG overall total. Emissions calculations including all GHG associated with fuel combustion are noted as a CO2 factor – where "e" stands as a CO2 equivalent of other GHGs that have been factored in. Referenced models 1 & 4 in this spreadsheet output only CO2 emissions; while referenced model 5 for asphalt construction yields CO2e as an output to capture GHGs associated asphalt processes.
- \*\* Material production includes crushing of aggregate and production of hot-mix asphalt required for asphalt paving.
- \*\*\* Includes material site development and reclamation, construction of road embankments, fence installation, culvert placement, hot-mix asphalt paving, and all incidental construction.

**Assumptions:**

- No project specific camp facility will be required. Project contractor will utilize available commercial facilities for crew housing and support.
- Contractor will acquire all project fuels at Deadhorse from commercial sources and not require project-specific fuel haul on mobe.
- Referenced models do not include potential emission premiums for construction in arctic environments. Such premiums must be independently applied.
- Project will be completed within two calendar years. The equipment fleet mix, construction methods, and schedule presented in this analysis are only representative for calculating the magnitude of emissions to be generated. Equipment use and duration is generally conservative for this purpose and not intended to specify how a contractor would sequence the work over the construction period.

**Conversions:**

- 1 HP = 0.7457 kWh
- 10,180g CO2 emitted per 1 gal diesel used.<sup>4</sup>
- 24.47kg CO2e emitted per 1 metric ton hot-mix asphalt placed (mix, laydown, and compaction).<sup>5</sup>

**Notes:**

- \* Hourly fuel consumption was reduced by 30% to account for equipment not utilizing full power output throughout the entire duration of construction activities.
- \*\* An "Arctic Factor" of 150% was applied to the 24.47kg CO2e emitted per 1 metric ton hot-mix asphalt conversion rate to account for small batch sizes and enviromental conditions.  
 24.47kg x 1.50 = 36.71kg
